Brick light buying guide

Brick lights can add a superb effect to any pathway and can be effective for domestic and commercial environments. They add safety to a walkway illuminating the pathway ahead and well as adding security to poorly lit areas.

Bricklights come in a number of different styles for example frosted glass front or frosted glass front with louvers which direct the light downwards and give less glare. There are also a number of lamp options available with brick lights you can buy the standard fitment ES screw cap fitting which will take a normal GLS lamp or a low energy equivalent, or you can buy the LED style which has a bank of LED'S within the light and are available in a number of colours. We would advise that the LED brick lights are just used for effect lighting as the light output is not as great as the brick lights that use standard light bulbs

Brick lights are usually standard brick size so are relatively simple to install just requiring one brick to be removed and the new brick light concreted into place. We would always recommend that a qualified electrician carries out any electrical installation work to ensure that all safety regulations are complied to.

Also available are step lights which add illumination to steps leading up to a building adding to safety if the area is poorly lit at night. These are bigger in dimension to the brick lights so will require a bigger hole to fit into. Again we would recommend that a qualified electrician carries out installation of these lights.
