Exterior lighting can add value and elegance to any house, we focus here on the garden bollard light fitting. They are normally installed to the side of a driveway or in the garden area. All of the bollards we supply come with a comprehensive manufacturer guarantee and also have the relevant IP rating.

The garden bollards in our range are constructed from either stainless steel or aluminium and offer excellent protection against the elements. Minimal maintenance is required to keep the bollards in top condition; we would recommend a yearly rub with normal cooking oil on the bare stainless or aluminium bollards to keep them looking good, more often if used in a harsh environment. The lacquered bollards need no maintenance at all.

The majority of the garden bollards we supply use a standard ES cap screw base lamp. We would recommend the use of a low energy lamp as a much more long term cost saving. A small number of the bollards we supply use a standard 50 watt GU10 halogen lamp which would not use low energy lamps.

Our bollards all come with a vandal resistant acrylic glass; majority of these have opal glass to diffuse the light from the bollard to give a more pleasant, less harsh light.

Installation of garden bollards is relatively simple. We would always recommend a qualified electrician carry out any installation of the wiring and that an RCD safety device is used. You would need to purchase the relevant size bolts to fit the bolt holes on the base of the bollard and long enough to give a good fixing in the ground. A suitable sized hole dug and filled with concrete then push the bolts into the concrete ensuring that the bolts line up with the bolt holes on the bollard. If you are mounting the bollard on a paving slab ensure that the bolts you buy are long enough to go through the slab and into the concrete.
